1. Moisture Testing Kit for Official Measuring

For official tests of moisture content of paddy in Japan, the Ministry of Agriculture, Forestry and Fisheries employ a method using 105℃ for 5 hours. In some other countries 130℃ for 1 hour is employed as an official test. However, some scientists claim that 135℃ for 3 hours gives the most reliable results. Whilst the official standard method in each country, temperature as well as heating time, may be varied according to their own conditions and characteristics, the basic principles of the test method remain the same.

1. Grind the grain sample with the grinder and accurately place 5g of the material into the aluminium container.
2. Turn on the heating element of the rotary dry oven and raise the temperature inside the oven until it is slightly above the target level.
3. Place the container into the rotary oven. About 18 containers can be put in the oven at a time.
4. The temperature inside the oven will fall when the door is opened, but it soon regains the temperature level after reclosing the door.
5. After reaching the predetermined target temperature level, switch on the thermostat and begin timing. The oven will maintain an even temperature and all samples will be subjected to uniformly high heating.
6. Open the door after the predetermined time has elapsed. Remove the sample containers and place them into the airtight glass desiccators for cooling before weighing.
7. Weigh the sample after cooling and calculate the weight loss for determining the moisture content of the material.
